

**Errata List for the book**  
**“A Primer on Scientific Programming with Python**  
**3rd edition**  
**by H. P. Langtangen**

Simple typos are not reported in the list below – only more serious errors that may lead to confusion.

1. Exercise 3.2, page 120: The sample call `s(3)` should be `sum_1_div_k(3)`.
2. Exercise 3.8, page 122: The points in the Midpoint rule are wrong, they should be  $a - \frac{1}{2}h + ih$ , so the rule reads  $h \sum_{i=1}^n f(a - \frac{1}{2}h + ih)$ .
3. Exercise 3.13, page 124: The text “case where 1, 3, 5, ...” should read “case where  $n = 1, 3, 5, 10, 30, 100$ .”
4. Exercise 4.23, page 184: Very large (and very small) values of the random numbers cause problems in some of the mathematical operations. Try out `A=1` and `B=2` as well as `A=1` and `B=100`. The exercise also asks to import three expressions from 4.21, but there are only two (this point is just dropped in a new version of the exercise).
