Errata List for the book "A Primer on Scientific Programming with Python 3rd edition by H. P. Langtangen

Simple typos are not reported in the list below – only more serious errors that may lead to confusion.

- 1. Exercise 3.2, page 120: The sample call s(3) should be $sum_1_div_k(3)$.
- 2. Exercise 3.8, page 122: The points in the Midpoint rule are wrong, they should be $a \frac{1}{2}h + ih$, so the rule reads $h \sum_{i=1}^{n} f(a \frac{1}{2}h + ih)$.
- 3. Exercise 3.13, page 124: The text "case where $1,3,5,\dots$ " should read "case where n=1,3,5,10,30,100.
- 4. Exercise 4.23, page 184: Very large (and very small) values of the random numbers cause problems in some of the mathematical operations. Try out A=1 and B=2 as well as A=1 and B=100. The exercise also asks to import three expressions from 4.21, but there are only two (this point is just dropped in a new version of the exercise).
